DETAILED ACTION

Claims 1-26 have been considered.

Election/Restrictions

5 Restriction to one of the following inventions is required under 35 U.S.C. 121:

I. Claims 1-7, 14-16, and 19-24 are drawn to a method for a user registering an authentication method in a server, classified in class 713, subclass 185 (*Electrical Computers and Digital Processing Systems: System Access Control Based on User Identification By Cryptography: Using Record or Token*). In this invention, the user registers the authentication method he desires to authenticate his identity when he accesses the server. After registration, the user can access the server by providing the authentication method to the server.

10 II. Claims 8-12 are drawn to a method for a host determining an authentication method by checking an entity, such as a cookie, on a user's computer, classified in class 713, subclass 183 (*Electrical Computers and Digital Processing Systems: System Access Control Based on User Identification By Cryptography: Solely Password Entry*).

15 III. Claims 13, 17-18, and 25-26 are drawn to a method for a user registering an authentication method in a security server via a web server, classified in class 713, subclass 185 (*Electrical Computers and Digital Processing Systems: System Access Control Based on User Identification By Cryptography: Using Record or Token*). In this invention, the user communicates with a web server and accesses a service through the web server but is registered with a third entity security server or security database.

20 The inventions are distinct each from each other because:

25 Inventions I, II, and III are subcombinations.

 Inventions I and II are related as subcombinations disclosed as usable together in a single combination. The subcombinations are distinct from each other if they are shown to be separately

Art Unit: 2137

usable. In the instant case invention II has separate utility because the user is not required to register his authentication method on an outside server. This invention is applicable to a system in which the user can set an entity on his computer indicating a preference and use it to access any server.

5 Inventions II and III are related as subcombinations disclosed as usable together in a single combination. The subcombinations are distinct from each other if they are shown to be separately usable. In the instant case invention II has separate utility because the user is not required to register his authentication method on an outside server.

10 Inventions I and III are related as subcombinations discloses as usable together in a single combination. The subcombinations are distinct from each other if they are shown to be separately usable. In the instant case invention I has separate utility because it can take place in a simple user to server environment and does not require a third entity security server or security database.

15 Because the inventions are distinct for the reasons given, restriction for examination purposes is proper. A burden is present to the examiner because inventions I and III are classified separately from invention II. Also, a burden is present to the examiner for inventions I and III because they require a separate field of search. Classes which reflect a third party authenticator need to be searched for invention III, including 713/155 (*Electrical Computers and Digital Processing Systems: Multiple Computer Communication Using Cryptography: Central Trusted Authority Provides Computer Authentication*). A complete response to this requirement must include an election of the invention to be examined even if the requirement is traversed.

20

Conclusion

A shortened statutory period for response is set to expire one month (not less than 30 days) from the mail date of this letter. Failure to respond within the period for response will result in ABANDONMENT of the application (see 35 U.S.C. 133, M.P.E.P. 710.02, 710.02(b)).
